ABSTRACT OF THE DISCLOSURE

A wood support piling is reinforced by a composite wrapping. The composite wrapping is formed on the wood piling by a filament winding process. Filament strands are impregnated with resin and wrapped around the wood piling The resin is allowed to cure to form a under tension. seamless layer which is uniform in thickness and materials. The composite wrapping is bonded to the wood piling and applies a compressive force on the wood piling to improve its The composite wrapping may be strength characteristics. applied to a portion of the wood piling where reinforcement is needed so that the piling can be manufactured economically. piling The composite wrapping protects the against deterioration and reduces the need for chemical preservatives which are harmful to the environment.
